CONCRETE
POLISH • RESTORE • REFRESH • MAINTAIN

" Making Your World Presentable "

Polishing refers to the process that will take a dull, maybe sealed or even rough concrete surface and transform it into a beautiful, smooth, and quality polished concrete floor. This process includes several levels of grinding, applying of densifiers and sealers, burnishing then finish buffing. By using the proper methods the concrete's natural beauty is brought to the surface.

The Restoration process may be required for an existing Polished Concrete floor that has over time experienced a large amount of degrading of its polished quality. Or it may be needed in response to a poorly polished concrete floor that did not hold its quality and beauty. In either case the process requires deep grinding, densifying, burnishing, sealing and buffing of the concrete.

Refresh an existing Polished Concrete floor is a process also known as revitalizing. This process addresses an already polished concrete floor that has experienced some dulling due to the wear of traffic. This process includes light grinding, reapplying of densifier, re-burnishing, sealing and rebuffering of the concrete floor.

No floor surface is maintenance free, so once we have transformed your concrete into a beautiful and quality Polished floor the question is, "How to you service it on a daily and periodic basis?" This is where a majority of your savings comes from. You will save from the reduced labor and product that would have been used to wax other types of hard flooring.

Polish

Restore

Refresh

Maintain

Based on the condition of the original concrete floor the grind and polish process will utilize a variety of metal diamond blades and resin grit pads followed by washing between each grind or polish. The adding of color is an additional step.

Depending on the condition of the original concrete floor the grinding and polishing process will utilize a variety of metal diamond blades and resin grit pads followed by washing between each grind or polish. The adding of color is an additional step.

Refreshing a Polished Concrete floor is required when aisles have dulled from regular traffic while the edges retain their shine. The process may be repeated up to three times using different grit resin pads for grinding.

Daily Maintenance consists of Auto-scrubbing with a neutral cleaner.

Periodic Maintenance may consist of a diamond grind, reapplying of sealer, auto-scrub and burnishing.
